

**ABSTRACT**

A method, system, and computer system for qualifying and selecting patients that are to be included in the electronic house call program are disclosed. A method to qualify and select patients to be included in the electronic house call program includes receiving an input that is associated with a patient. The input is assessed using at least one qualifying module, where the qualifying module has at least one predetermined parameter. Thereafter, a determination is made to determine if the input is a qualified input. Then the patient associated with a qualified input is enrolled into the electronic house call program.

ABSTRACT OF THE DISCLOSURE
